The CompleteSolarRoof

Application:

Disguised as conventional roof tiles, C21e solar electric tiles and C21t solar thermal tiles together form the **CompleteSolar Roof**, generating electricity and hot water respectively.

The

CompleteSolar

Roof offers significant savings on energy bills to the end-users. A typical system will generate over 60% of the hot water requirements for a three-bedroom home. The C21e photovoltaic tile uses the most efficient cells available on the market, requiring just 8m² per kWp of electricity per year from this area. Excess electrical energy produced by the C21e can be sold to the national grid.
